What are effective interventions to reduce the increase in elective cesarean section in low risk women

Chrystal Curran, Brianna Tan, Kimberley Kelsey, Sara Shea, Heather Holland, Sasha Riley, Mary Uy, Crystal Hunter, Tenzin Tsomo, Fasha Ruys-Solorzano and Dolma Tso

Introduction

- According to Annals of Family Medicine, “The percentage of babies born by cesarean section increased in the United States from 4.5% in 1965 to 26.1% in 2002. Nearly 40% of cesarean sections are repeats.”
- According to Maternal Health Study Group of the Canadian Perinatal Surveillance System, “The overall severe maternal morbidity rate was 27.3 per 1000 deliveries (i.e., 27.3) for women in the planned cesarean delivery group, versus 9.0 among those in the planned vaginal delivery group.”
- A research study (Wiklund et al., 2007) surveyed Swedish primiparous women who requested a cesarean section (n=91) or experienced a vaginal birth (n=286). Data from 70 women demonstrated that fear of childbirth was the most common reason for the request.
- The research question will address the problem of complications related to elective c-section and establish interventions that will help reduce requests of c-sections without medical justifications through educational modalities.

Study Design/Sample

Findings

- WHAT ARE THE REASONS FOR ELECTIVE C-SECTION?
  - fear of the pain of childbirth
  - fear of loss of control or safety
  - fear of body being less attractive after childbirth
  - believes that a cesarean section is the safer, more responsible choice

Cesarean Section Risks

How to Reduce Elective Cesarean Section?

- Continuous labor and delivery support
- Increasing women’s access to non-medical interventions during labor, such as continuous labor and delivery support to reduce cesarean birth rates.
- One-on-one support during labor and delivery was associated with a reduction in cesarean delivery rates.
- Cesarean section in low risk women accounts for precipitous or unplanned VBAC deliveries.
- Cesarean sections pose a much greater risk for maternal morbidity and mortality than vaginal delivery.

Conclusion/ Further Study

- Based on the research we have found effective interventions to reduce the increase in elective cesarean sections for low risk women. For most pregnancies cesarean sections pose a much greater risk for maternal morbidity and mortality than vaginal delivery.
- Continuous labor and delivery support has been associated with a reduction in cesarean deliveries and improved patient satisfaction.
- Organizations and governing bodies should work to ensure that research is conducted to provide knowledge and promote policy changes. As an interdisciplinary team we need to encourage women to articulate their concerns and develop strategies to promote confidence and competence in childbirth. There needs to be a greater push for prenatal childbirth education, and continuous support during childbirth.

Summary/Implications for Practice

- Educational Risks and benefits For certain clinical conditions cesarean delivery is firmly established as the safest route of delivery. However, for most pregnancies cesarean delivery appears to pose greater risk of maternal morbidity and mortality than vaginal delivery.
- Prental care educational programs to address concerns
- Information to be tailored to their individual needs
- Assist women to articulate their concerns and develop strategies to promote confidence and competence in childbirth.
- Multidisciplinary research needs to examine women’s childbirth beliefs and decisions within the broader sociological context.

Health Policy changes (National/Regional)

- Individuals, organizations, and governing bodies should work to ensure that research is conducted to provide knowledge and promote policy changes that safely lower the rate of primary cesarean delivery.

Continuous Labor and Delivery Support

- One-on-one support during labor and delivery was associated with improved patient satisfaction and a statistically significant reduction in the rate of cesarean delivery.
- Health care providers should address women’s psychological needs during pregnancy and give continuous support during childbirth.
