Question 1a:
Do you know what AT is?

a) Yes
b) No
c) I think so, but I’m not positive
Question 1b:
Do you know what AT is?

a) Yes
b) No
c) I think so, but I’m not positive
Question 2a:
Which of the following would be considered AT?

a) modified pencil grip
b) computer / software
c) block chair
d) visual timer
e) all of the above
Question 2b:
Which of the following would be considered AT?

a) modified pencil grip
b) computer / software
c) block chair
d) visual timer
e) all of the above
Answer:
Which of the following would be considered AT?

a) modified pencil grip
b) computer / software
c) block chair
d) visual timer
e) all of the above
AT and Neurodevelopmental Disorders

• There is a lack of research efficacy concerning the use of assistive technology in individuals with cognitive deficits. Approximately 3% of the U.S. population has intellectual disabilities with varied etiologies.

• In our work with many types of neurodevelopmental disorders we have seen anecdotal improvements with use of AT (Hagerman, 1999a, 1999b, 1999c; Scharfenaker, O’Connor, Stackhouse, Noble, 2002).
Some New Evidence / Research

- Effectiveness of Reading and Mathematics Software Products: Findings from the First Student Cohort (Report to Congress)

AT Intervention Efficacy Study

**riter® 4000**
- word prediction software.
- Reduces total number of keystrokes required
- facilitates correct spelling
- features auditory feedback
- grammar and vocabulary support

**Write:OutLoud®**
- talking word processor
- Also reads imported text
- Provides visual and auditory feedback
- Software from Don Johnston Inc.

Advancing Cognitive Technologies
University of Colorado School of Medicine
State-of-the-Science Conference
October 25 & 26, 2007
Purpose: AT Intervention Efficacy Study

To carry out an intensive training program for subjects with a broad range of neurodevelopmental disabilities to assess the efficacy of AT intervention for the group as a whole. We will also evaluate whether some etiological groups (defined by differing cognitive phenotypes) will obtain greater benefits from this assistive technology than others.
Subjects

- Our subjects include individuals with Neurodevelopmental disorders including: fragile X syndrome, sex chromosomal abnormalities, Down syndrome, fetal alcohol syndrome and autism spectrum disorders.
- We are enrolling both males and females ages 8 to 20.
- Control subjects matched on diagnosis, age and IQ.
- Subjects are randomized into intensive intervention group and standard of care (control) group. Those subjects initially placed in control group will be offered intensive treatment the following year.
Enrollment to Date

- Total Subjects to Date: N = 32
  - 2 subjects disqualified to continue: 1 due to reading level lower than 1st grade, 1 due to cognitive level too high
  - 17 randomized to intervention group, 13 to control group
  - 10 subjects have completed 1 year of intervention
  - 6 subjects have completed control year, rolled over to intervention group

- Mean Age: 12 years
- Mean Verbal IQ: 78
- Mean Performance IQ: 74
- Mean Full Scale IQ: 76
- Mean Reading Level: 5th grade 1st month
- Mean Writing Level: 3rd grade 6th month
Enrollment by Diagnoses

- Fragile X Syndrome: N=6
- Fragile X Premutation: N=1
- Autism/ASD: N=1
- Down Syndrome: N=4
- Tourette Syndrome: N=2
- XXYY Syndrome N=1
- Mental Retardation: N=1
- Learning Disorder: N=2

- Total Enrollment: N=32
Procedures

• Baseline
  – IQ Testing
  – Visual Motor Integration Testing (VMI)
  – Reading /Written Expression Battery: Mini-Battery of Achievement (MBA), Process Assessment of the Learner (PAL), Test of Written Language (TOWL-3)
  – School Function Assessment (measures school participation and any AT applications implemented)
  – Parent and Teacher Questionnaires / Surveys
  – Families and schools will receive summary of test findings and recommendations including the use of AT

• Reevaluation at 1 year
Intensive Intervention

- Direct treatment training of student at M.I.N.D. clinic and home on use of software
  - Introductory trainings
  - Follow up treatment sessions
- Treatment Plan School Educational Staff
  - Introductory trainings for teachers
  - Consultations regarding use of software for specific lesson plans / units
Sample Intervention…

• 12 year old boy with FXS
• Great memory for faces and names.
• Enjoys singing and playing music.
• He dictated his sentence to the therapist about a preferred / motivating topic.
Co-Writer Example:
CO:Writer and Write:OutLoud
Working Together:
Expected Outcomes

• We expect that the subjects who receive the intensive intervention will show significant gains in educational participation in written expression (including handwritten and computer generated written tasks), versus those subjects in the standard of care group.

• We expect that the caregiver and teacher questionnaires may show that the two groups show differences in the use of written language for educational use at the end of the intervention or standard of care period.

• We expect that the use of AT may help improve the educational participation and writing skills of individuals with differing levels of cognitive functioning and also those with neurodevelopmental disorders of differing etiology.
Preliminary Descriptive Findings

• Some individual cases have demonstrated an increase in the number of words typed within a 15 minute session when “writing about a picture”
  – One subject’s baseline was 0 words and at close of study typed 10 words

• Number of handwritten words also slightly increased
  – One subject’s baseline was 133 words and at the close of the study he wrote 254 words.
  – May indicate that overall process of writing is improving via access to the software
Preliminary Descriptive Findings

• Some individual cases have demonstrated a decrease in the amount of time it takes to type a sentence.
  – One subject decreased time by a full minute
  – Handwriting time remained the same

  • May indicate continued struggle with graphomotor skills necessary for handwriting / penmanship
TOWL- □ Spontaneous Writing Task

- Subjects are asked to write a story about a picture for 15 minutes.
- Boy with FSIQ 68, Learning Disability, ADHD:

Pre-intervention:

Post-intervention
My story is a man and a woman, a husband and a wife, a 
spear and a gun, but the little wars a thing and rock the 
air, toward the thud and the gun, it has a little thud and a 
rose of the air that had a spear. The wind with the thud the air

The man found the umbrella in the grand another place was
shining the man on and the man was happy and he not 
all the other people were. The ship home to where 
happy to go home to tell they family and they were 
do be home and they are, she the umbrella to the wind and the where 
exposed and evidence the wind wind and they where truth.
Pre-intervention: 13 years 4 months, 7th grade, 40 words

This is a story because it was a cave men can be a good drawer and they have a spear and they can eat food and they have a fire and they have a club log they have a basket.

Post-intervention: 14 years 6 months, 8th grade, 42 words

The man has a spear and the 1 man is eating the one man is using a bat and the other one man is sitting by the fire and the other one woman is holding the bag with stuff and they were happy.
Results

- Group of 10 subjects who have completed 1 year of intervention using the software:

Despite lack of statistical significance, qualitative findings indicate that individual cases have made improvements in written expression as measured by the TOWL.
1. I am comfortable using the computer
2. I feel it is important to augment writing when it is difficult for children
3. I feel that good writing is an important part of learning
4. I understand how to use Co:Writer
5. I understand how to use Write:OutLoud
6. I think using software will help me teach writing
7. I think being taught how to best use the software will help me with teaching writing
8. I would be likely to use the software on my own without additional intervention
9. My child writes better when he/she uses the computer
10. My child struggles with writing – legibility
11. My child struggles with writing – effort/time
12. At this time I feel that my child’s writing is OK
13. At this time I feel that my child’s writing could be improved

AT Intervention Challenges

• One big challenge of this study has been the implementation of the use of the software in the school setting.

Why do you think this might this be
Question 3a:
Why is it difficult to implement the use of Co:Writer and Write:OutLoud in schools?

a) no computers available
b) computers are available but cannot run the software
c) lack of teacher/administrator buy-in
d) lack of efficacy research, therefore school $ is not spent on AT applications
e) all of the above
Question 3b:
Why is it difficult to implement the use of Co:Writer and Write:OutLoud in schools?

a) no computers available
b) computers are available but cannot run the software
c) lack of teacher/administrator buy-in
d) lack of efficacy research, therefore school money is not spent on AT applications
e) all of the above
Answer:
Why is it difficult to implement the use of Co:Writer and Write:OutLoud in schools?

a) no computers available
b) computers are available but cannot run the software
c) lack of teacher/administrator buy-in
d) lack of efficacy research, therefore school is not spent on AT applications
e) all of the above
AT Intervention Challenges

• Coordinating AT visits with teachers, staff, principles, school district IT support
• Family comfort and knowledge about general computer use
• Students refusing to use software at home
• Lack of continuity between home and school for flow of tasks/work applicable to the software
Teacher Comments

• “I was so thrilled to see a program that was so user friendly and made such sense for those with writing and speaking barriers. The kids know what they want to say...it’s just getting it communicated that keeps them frustrated...For some of our guys, it would be useful if they can approximate the first few letters...”

  – Excerpts from a Junior High School, SH SDC teacher following her initial training and introduction to the software
“I see much benefit to the CO:Writer and Write:OutLoud programs. With training for teachers and parents - this can be a great aide in the classroom and home environment. It provides many benefits as we have witnessed through our daughter, including extending the depth and amount of writing taking place. Allowing for corrections, audio feedback, and the comfort of using the computer - which I feel is the greatest impact as we know computers are the tool of the future and opens doors otherwise unavailable to all children!”

☐ Parent of 6th grade girl diagnosed with FXS
Parent Comments

• “It was difficult to get him to use it at home because there was no buy in from the school so it was very hard to carry over. I also feel that had he been exposed to this software when he was younger, in junior High, it would have been a no-brainer, but in High School it is very difficult to coordinate things with all the various teachers etc.”

• Parent of High School Senior (now a GRADUATE)
Parent’s Perspective:

• This parent does not have experience using the computer.
• Multiple home visits and phone conferences were needed in order to get the parent familiarized with the software.
Initial Reaction:
Current Perspective:
Future Directions:

Question 4a: How should we prioritize future research regarding the use of AT with people who have cognitive disabilities?

a) research about computers / software
b) research about simple devices that can be implemented easily
c) research about use of high-tech devices
d) research development: making new devices that don’t exist yet
e) all of the above
Future Directions:
